Ascension SMP planned features

Introduction

Welcome to Ascension SMP! The concept of this server is that there are 7 “Natural Orders”, each with unique passive, utility, and combat abilities. All players start out as “demigods”, which allows you to mix and match abilities. You can also become a “god”, which locks you to one order, but the abilities are upgraded and you receive a mythical weapon. There is only 1 god from each order.

These are the 7 natural orders:

Ocean Sky Earth Flora Magic Nether End

Influence

The server resource is a golden, glowing cube called Influence.

- All players start at 0 influence.
- +1 when killing someone, -1 if you die. Dying to natural causes drops the influence item where you died if you are on positive influence. If you are on 0 or below, nothing drops.
- You can go into negative influence if you die from 0 influence. If you die at -5 influence, you are banned for 1 day.
- If you are on negative influence, you can craft influence to get back to 0. Crafting influence automatically adds to your total and does not actually give an item. The recipe is AAA-BCB-DDD from top to bottom, A is echo shards, B is netherite scrap, C is totem of undying, D is gold blocks.
- You can use /withdraw to convert your influence stat into an item. Note that this does not work on already unlocked abilities or if you are on negative influence.

Abilities

Every player can equip 1 passive, 1 utility, and 1 combat ability. In order to equip something, you need to unlock it first by spending 1 influence.

Type /ascension to open a chest inventory that displays your current influence, what you have equipped as your passive, utility and combat, as well as the 7 orders with descriptions of their abilities. Left click to see more details and click to unlock and/or equip an ability.

Project Architecture Details

1. **Orders**. Orders follow the order default class, which contains all the different events that could be implemented by the order. For example onBlockBreak, Earth needs to check if it is an ore block and if so double the ore drops and xp.

    a. Each concrete order implementation is a singleton design pattern that has an instance of itself as well as a reference to the God version(separate class) in getVersion.
    b. The singleton instances are put in the OrderRegistry to display in the ascension menu.
2. **Spells.** Spells are more structured abilities that can be activated, have some kind of effect, and go on cooldown. From a player's perspective, if they equip a passive/utility/combat from an order that has a spell, they can run /bind <hotbar slot> <spellid> to bind the spell to a hotbar slot. When they switch to that hotbar slot, they will see the spell name and id in the action bar. Before use, the spell is "ready". Then they can shift + right click to activate the effect of the spell, which puts it to "in use". Once the effect is over depending on the implementation, it is on "cooldown" and cannot be used again until the cooldown is up. When switching abilities, any associated spells are unbound automatically, or you can run /unbind <spellid>. There is no "cost" to casting a spell besides the cooldown.
    a. Spell effect implementations are in the SpellRegistry. Cooldowns are managed by the SpellCooldownManager. The spell interface is in Spell.java and to allow demigod/god classes to specify different stats for a spell, Spells take in a SpellStats object whose features are defined in each order.
    b. Spells always deal a special type of damage that bypasses armor and deals "percentage" damage. For example if a spell does 30% max hp, to an iron golem it would do 30 hp(⅓ * 50 hearts), to a player it would do 6(⅓ * 20 hearts).
3. **Abilities.** Using the AbilityManager, mixins can be registered that check if any order needs to do something with that information by calling broadcast in abilitymanager or anymatch, etc. Mixins should always go through this class instead of checking for equipped orders directly. Complicated abilities like shapeshift may need their own managers defined but still should go through the class to actually check if the effect is applied.
4. **Task Scheduler.** Upon first loading the mod, a task scheduler is initiated in the main class Ascension. There are continuous tasks, delayed tasks and repeated tasks in the api folder. Things like spell execution use these tasks to work, and any future effects that are similar should also use these.
    a. Continuous tasks run until the mod is unloaded, they have a delay between execution and can be manually stopped.
    b. Delayed tasks run once after a certain delay.
    c. Repeated tasks run continuously for a certain duration.
5. **Animation Library:** The mod uses block display animations to create visuals that are good but also vanilla only, in the animation folder. VFXBuilder has a framework that allows you to chain delayed tasks together to create a whole animation and send the interpolation packet to the client once created. It also allows for particles to be spawned at each "keyframe". The sticky version allows you to put null values to remember things from the previous keyframe, and vice versa for the non-stick version. Some examples are already present in the folder.
    a. In general, each animation should have arguments for specifying things like particle count, size, and other features for easy changing in spells.
    b. GeometrySource.java has some helper functions for aligning a block display along a vector, choosing random points, etc.

6. **Persistent Data Manager:** The mod stores player data in player attributes.The saving is actually done in the SeverPlayerMixin, but the interface is in AscensionData.java. This data is the truth for what influence the player has, their abilities, spell bindings, rank, and unlocked abilities.
7. **Ascension Menu:** When the player runs /ascension, they can see a book menu that has the 7 orders and information about their influence and equipped abilities. This uses https://github.com/Patbox/sgui to make the book menu.
8. **Utils:** Various static helper methods for different things are located in Utils.java.
9. **Config:** Try to keep things configurable by defining things in Config.java. We use https://github.com/TheElectronWill/night-config to generate config files. Keep the config readable with comments.

Demigods

Demigods are the default state all players are in. They can mix and match different order abilities, but have weaker versions compared to gods.

1. Earth

Passive: Permanent haste 1. Ore drops (xp and loot) doubled and automatically smelted. Anvils are 50% cheaper. Anvils do not break when used. No “too expensive” limit when using anvils.

VFX: When ore drops are affected, flame particles are displayed around the broken block.

IMPL. SPECIFICS: The actual price in the anvil menu should change if possible, instead of something like displaying a 30 level cost but only charging 15 once the player actually clicks it.

Utility: Supermine spell. Mine in a 2x2x2 cube. Up to half the blocks mined, if actually broken, count towards durability loss. Works with earth passive - that is, ore drops are doubled and smelted if the player has earth passive equipped.

VFX: When activated, play some anvil sound effects as an indicator.

IMPL. SPECIFICS: Supermine should not activate if the player is not mining a block with the correct tool. For example, if the player is mining dirt with a pickaxe do not activate supermine. Also, it should not break unbreakable blocks like fluids, air, bedrock, barriers, etc.

Combat: Magma bubble spell. Creates magma spikes in a 4x4 centered at the player, dealing 30% max hp. Must be activated within 1 block of solid ground, or in lava. Cooldown 45 seconds.

VFX: In a 4x4 area centered around the player, pick 16 evenly distributed points that are on a solid block and draw a vector in a random direction facing up from each point. Then spawn a magma block display, face it in the direction vector and extend it to make it look like spikes coming out of the ground. During extension, spawn campfire smoke particles from the ground and around each spike, spew lava particles around the edges. Hold for 1 second and then shrink the spikes towards the ground. The only thing that should be changing is the height of the spikes.

IMPL. SPECIFICS: The actual “hitbox” of the spell should be a 4x4x2 box centered at the casting area and extending upwards.

2. Sky

Passive: No fall damage. 50% less dripstone dmg. Breezes are passive. Double Jump “spell”, upon toggling flight (jump twice quickly) propels the player 7 blocks in the air. 8 second cooldown. All projectiles lose 50% of their velocity. Filtered for damaging projectiles and potion types

VFX: On double jump, spawn a dash cone below the player. (See dash)

IMPL. SPECIFICS: Double jump uses the same “activation → effect” logic as spells, but it isn’t bound to any slot and is only activated by jumping twice. The cooldown is also kept track of within the sky order, like supermine. Also, in no circumstances should a player be flying in survival.

Utility: Dash spell. Propels you 9 blocks in the direction you’re facing.

VFX: Spawn a dash cone in the reverse direction that the player is dashing towards. Take the velocity vector of the dashing direction and pick points on a hollow circle perpendicular to it behind the player. Then draw vectors that form a cone from each of the selected vectors, and apply random speed to the particles along that path. Block displays should also be randomly rotated over the course of the path and have a block palette of white “cloud” blocks like white wool, white stained glass, and white concrete powder. The intention is to create something similar to a sonic boom behind the player as they dash/double jump. Play the wither shooting sound effect.

Combat: Star strike spell. Summons a beam of light wherever you look to a maximum of 32 blocks, does 30% hp to anyone who touches it for the duration of the beam.

VFX: Trace a line from the player's look vector to the nearest intersected block or up to 32 blocks away. That point is the target. Then pick a random point on the filled circle with radius 10 60 blocks above the target. That point is the origin. Spawn a block display and then stretch and expand it until it looks like a laser that covers the target and starts at the origin. The laser should stretch in height from the origin to the target during the grow phase, then hold for the duration of the spell, then shrink but DOWNWARDS, not towards the sky. The inner laser beam is a sea lantern block and the outer “glow” of the laser is a white stained glass pane, which should be centered on the inner layer. Apply the glowing effect to the laser as well, colored white. During the hold ticks, spawn end rod particles around the ground to indicate the area of effect. The intention is a beam that looks like it comes from the sky to strike the target point.

IMPL. SPECIFICS: The actual “hitbox” is a 2x2x3 area

3. Ocean

Passive: Permanent water breathing. Autocritting in water. Walk over powdered snow. Dolphins grace spell. Activate to switch between dolphin’s grace 1 and no dolphin’s grace.

IMPL. SPECIFICS: Walking over powdered snow should have the same mechanics as with wearing leather boots. For example, you can still crouch to go through the powdered snow and you do not take any fall damage.

Utility: Molecular flux spell. For 8 seconds, immediate water-related blocks that you're looking at within a distance of 20 blocks transform. Water source -> frosted ice (Water source must not intersect caster's hitbox) frosted/normal/packed ice -> water source (OVERWORLD AND END ONLY) (blue ice unaffected) Cobweb -> air Wet sponge -> dry sponge Water cauldron <-> powdered snow cauldron.

VFX: Spawn a particle trail of splashes along the caster's eyeline. If a block is transformed, spawn ice particles around the block. The intention is an indicator as to which block is being transformed.

Combat: Drown spell. For 7 seconds, players in an 8 block radius have their breath meter set to 0. Also lets you use autocrits on land, if the ocean passive is equipped.

VFX: Spawn water particles all throughout the 8 block area. They should float in the air for the duration of the spell, and then fall to the ground once the spell is over. The intention is many droplets of water suspended in the air that stay for the duration of the spell.

IMPL. SPECIFICS: The breath meter should always visually be zero for all players. Also, if there are any other players with the ocean passive, they should also be able to autocrit. Water breathing or conduit power does not bypass the effects of this spell.

4. Magic

Passive: Permanent speed 1 Illagers are neutral. Enchanting tables are 50% cheaper.

IMPL. SPECIFICS: Just like with Earth passive, actually change the visible prices in the enchantment table.

Utility: All effects shorter than 5 minutes drank, from tipped arrows, or splashed onto you turn into 5 minute duration. Tipped arrows become 1 minute Excludes turtle master and negative effects.

VFX: Pick random points around the player's feet and spawn block particles rotated randomly from a palette of pink blocks: Pink stained glass, pink concrete, pink glazed terracotta, etc. Pick vectors that face up towards the player and move them along the trajectory, rotating randomly for random durations. The blocks should also get more transparent as they approach the top of the player's hitbox to avoid obscuring their view. The intention is a pink flame that appears whenever an effect is given. Scale the number of particles based on how much duration was given for the effect.

Combat: Shapeshift spell. Allows you to transform into the last mob you killed, including players. Lasts a maximum 30 seconds, and if you die as the mob you die for real. Up to 5 mobs can be remembered in the player's history, and once used up the player must kill another mob to replenish their transformations.

VFX: For the caster, if they have this spell equipped they can run /sh to see their history and what they will transform into next, if any. Upon transforming, apply night vision that lasts for the same duration as the spell so that when they are about to transform back, they get the darkness pulsing on their screen as an indicator. Send a private chat message that tells them what they have transformed into.

IMPL. SPECIFICS: The transformation history is a stack, so if a player kills an iron golem then a pig, they first transform into the pig. Then if they kill a creeper, they will transform into a creeper first, then an iron golem. Demigods cannot transform into boss mobs or other players(Elder guardian, Wither, Ender dragon, and Warden). We use the

DisguiseLib https://github.com/NucleoidMC/DisguiseLib library for sending fake packets to the clients OTHER than the caster. Mobs that can fly should be able to fly, such as bats, vexes, ghasts, etc. Undead mobs should also burn during the day. In general, any simple mob effects that can be applied should be applied. The health of the player should also scale based on the health of the actual mob they are transforming into.

5. Flora

Passive: Debuffs don't affect you. Bees are passive. No trampling crops. Food gives 2x saturation. Permanent Regen 1.

VFX: When a debuff is applied, spawn happy villager particles to indicate healing.

IMPL. SPECIFICS: Any debuffs have their durations set to 0.

Utility: Within 5 blocks of a plant block or if the player is holding a plant block: Sculk sensors and shriekers ignore you. Mob aggro distance reduced by 50%. Creepers are neutral.

VFX: If the spell is active, spawn falling leaf particles passively around the player. The intention is to show that the player is being “hidden” by plant material. Also play a composting sound effect when the effect is deactivated.

IMPL. SPECIFICS: Check for nearby blocks only every second to avoid lag. Plant blocks include leaves, grass blocks, plant blocks, and in general anything that is actually “alive” and a plant. Things like logs do count, but planks and stripped wood for example do not. This also applies to nether flora.

Combat: Thorns spell. Thorns impale your opponents from the ground, freezing them for 3 seconds and giving them poison 1 for 10 seconds. This does 15% max hp.

VFX: Pick random points around the target, and draw vectors to different points in the target’s hitbox at varying heights. The thorns should be wood blocks growing in size and height from the origin points in the direction of the vectors through the target. The thorns should remain there for the duration of the freezing effect, then shrink in width to disappear while remaining the same height. The intention is that it looks like wooden thorns are impaling the target, holding them there, then withering to disappear.

IMPL. SPECIFICS: The trapped player should not be able to jump, “slightly” move, or any normal movement. Use attributes instead of effects to accomplish this, such as setting the jump height to 0 and movement speed to 0. If the player ender pearls away or eats a chorus fruit or is otherwise somehow moved out of the thorns before the spell is up, allow them to, but deal an additional 10% max hp because they are “pulling themselves out of the thorns”. Allow other actions like using shields, eating, switching hotbar slots, etc. as long as there is no movement. This spell is also an “on hit” activation, which means that when the spell is activated, initially nothing happens. A 10 second countdown begins, during which the spell is in use, and the next living entity that the player hits is considered the target of the spell. If the 10 seconds elapses, the spell goes on cooldown automatically and the player receives a private message indicating their window has expired.

6. Nether

Passive: Fire resistance spell. Allows the user to toggle between fire resistance and no fire resistance. Nether mobs are neutral. Ability to swim in lava. Autocrit when on fire.

IMPL. SPECIFICS: “Nether mobs” means any mob that is located the nether. For example, if a skeleton goes through a nether portal, now they are in the nether and are neutral to the player with this passive equipped. Swimming in lava should be s similar as possible to regular swimming in water. Depth strider should also be applied, if the player has it. If it is not possible to use the vanilla swimming system, replicate it using flying mode.

Utility: Ghast carry spell. Summons a normal health happy ghast you can control and fly using. SPEED: 6 b/s. Automatically mounts the player on the happy ghast and the ghast is summoned directly above the player. It has a red harness. If the player is below the hitbox of the ghast or more than 5 blocks away, the ghast despawns. By itself, the ghast has no AI unless being controlled. There is no limit to the amount of time the ghast can be summoned for.

VFX: Spawn soul particles above the player around the footprint of the ghast upon summoning and despawning.

Combat: Soul rage spell. For 20 seconds you deal more damage the lower on hp you are, but you also take 120% damage.

VFX: Spawn soul particles that get more dense the lower the player is.

7. End

Passive: End mobs are neutral. ½ second pearl cooldown. (Normally 1 second) Ender chests have an extra line of capacity.

IMPL. SPECIFICS: The “Ender Chest” text for the increased capacity players should be bold and purple. The extra line should be added below the existing 3 lines, and should act exactly like an ender chest: can only be accessed by the owner, persistent upon leaving/rejoining/dying/different dimensions. If the player unequips this passive, disallow them from doing so until there are no more items in the extra line in the improved enderchest.

Utility: Teleport spell. Teleport 10 blocks in the direction you’re facing. Goes through up to 2 blocks, and cannot spawn you in another block (suffocating). If there are no valid blocks the spell fails.

VFX: If the teleport is successful, spawn enderman teleport particles around the player and around the destination, and play the enderman teleport sound. If unsuccessful, indicate it in the chat and play the teleport failed sound effect.

IMPL. SPECIFICS: Draw a ray from the player’s looking direction. Along the path, keep a counter of how many solid blocks have intersected. Once the counter reaches two, consider that distance the limit of the teleportation and find the farthest available valid block as the destination. The teleport block should be empty or a non-solid block. Teleporting straight up into the air is valid. Fail if there are no valid teleport blocks within the distance.

Combat: Desolation of time spell. All combat abilities are disabled for 5 seconds and weakness 1 applied within a 7 block radius for 10 seconds. Does not disable god weapons abilities.

VFX: Recursively draw a dragon curve for a few iterations within the area of effect out of purple stained glass blocks, and spawn dragons’ breath particles in the area of effect. Once the duration is over, the dragon curve should fade in opacity until disappearing. Play

the dragon roar sound effect pitched down upon casting. The intention is a surreal but geometrically perfect visual that basically just looks cool during casting. It would also be cool if the curve could be unique every time the spell is cast, for example randomly rotated. The curve should aim to fill as much of the casting space as is possible, and never “spill” outside of the hitbox.

IMPL. SPECIFICS: The “hitbox” of this spell is a 7x7x2 area, with the height being above the casting position. The weakness is only applied initially if the target is in the area, but the combat disabling remains if the player is within the area and 5 seconds after the spell ends or the target leaves the area. Any effects that were already cast continue, but players trying to cast a new effect get a failure indicator if they try.

Gods

There can only be 1 god per order. They receive a special mythical weapon associated with their order and the abilities they have are stronger compared to demigods. However, they cannot equip abilities from orders other than the one they are the god of.

God classes extend the main demigod class, and in general their effects are the same except buffed. Therefore completely-reimplementing a demigod ability should be avoided unless super simple or necessary. Current gods should be kept track of persistently, and no player should ever be the god of two things at the same time. Also, no player should ever have multiple mythical weapons or have one while not being a god.

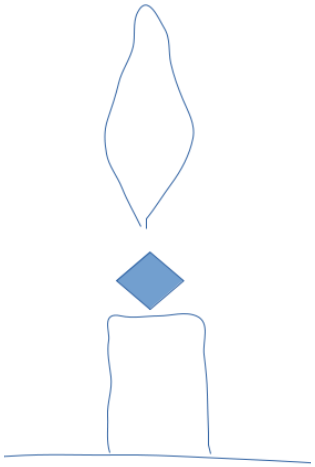
God Promotion

- If there is no current god of a natural order, the first player to equip the passive, utility, and combat of that order and then spend 1 extra influence in the ascension menu becomes the **God** of that order. Once a player equips the passive, utility, and combat they receive a chat message if they are able to promote and an extra page appears in the order description that they can click and allows them to promote to a god. Upon promotion, they automatically receive their mythical weapon.
    - Mythical weapons also use the AbilityManager to hook onto their abilities. Apply the custom model data as the name of the weapon, for example Tempest Trident -> tempest_trident string. Register them in WeaponRegistry.java to allow for easy association between orders and weapons, and to check if a player has one already.
- If there is a current **God** of that order, you need to kill that player to become **God** of that order. If the killer is already a **God**, it resets to no god.
    - Gods can also be replaced in the challenger trials, see below.
- When a **God** dies they lose **1 Influence** and their **God** status. They also cannot return to **God** status for 24 hours.

Challenger Trials

Players can craft a challenger’s sigil whenever. The recipe is ABA-BCB-ABA from the top down, where A is gold blocks, B is copper blocks(waxed or normal, but not oxidized), and C is an ominous trial key. The player can then go to one of the 7 shrines around spawn representing the 7 orders. Each shrine is themed around its respective order and looks like a

pedestal on the bottom with a rotating cube in the middle and a floating bit on top. There should be a command that is registered that allows admins to place the structure based on the order and automatically remembers where the location of the shrine is.



If players take the challenger's sigil and right click the cube in the middle, a Challenger Trial begins.

Lifecycle of a Challenger Trial:

1. Check if the associated god is online or if challenges are on cooldown (see #6). If they are not online, nothing happens and the challenger receives a message.
    a. If a god is ever challenged during a day but was never online, the loss counter increases by 1.
    b. This does not stack per day, you can only lose once per day.
    c. If the loss counter reaches 2, the god is demoted.
    d. The loss counter cannot go below 0.

2. If the associated god is online, broadcast in chat that the God of <order> is being challenged. They have 5 minutes to accept (by going to the shrine) or forfeit (by doing nothing). If the god forfeits the loss counter increases by 1.

3. If the god accepts by coming within 30 blocks of the shrine, the actual challenge begins. The cube in the middle is an attackable item entity that the challenger(s) can hit. A boss bar appears that indicates the remaining health of the cube.
    a. The cube has 500 health(same as a warden) and can only be damaged by melee attacks, not projectiles or otherwise.
    b. The cube passively heals at a rate proportional to how close the god is to the shrine. 20-30 blocks: 1 hp/s. 10-20 blocks: 2 hp/s. 0-10 blocks: 3 hp/s.
    c. If the challenged god gets a kill, the cube heals by 80 hp.
    d. If a player right clicks the cube with a diamond block, it heals by 30 hp.

4. The challenge can end early in two ways: either the challenger dies, or the god dies. If the god dies, the challenger is promoted to become the new god. If the challenger dies, the loss counter decreases by 1 and the challenge is over.

5. After 10 minutes have elapsed, if no other condition has been fulfilled the god wins and the challenge ends.

6. A text display is shown above the cube, no further challenges can be made for 1 hour from the time of the challenge end.

IMPL. SPECIFICS: If you are a god in the radius of the challenger trial, you cannot be killed in 1 hit from 100% max hp. At most, any attack will deal 50% max hp. However, if you are lower than 50% max hp then you will still die. When the challenge begins, the surrounding terrain from the moment of the admin running the command is reset and all additional placed blocks are slowly broken and break in 5 seconds. For example, if I were to place an obsidian block in the area, the block would automatically break in 5 seconds. Fluids also disappear in 10 seconds, but can flow for however long they are present. All non-living entities are also removed upon resetting the terrain. Add a command that allows admins to set the radius of the resetting terrain or resetting the location of the shrine which updates the terrain memory.

BELOW ARE THE CHANGES TO DEMIGOD ABILITIES FOR GODS. USE THE DEMIGOD ABILITIES AS A BASE FOR THESE. UNLESS OTHERWISE SPECIFIED, ALL VFX IS THE SAME BUT JUST BIGGER, MORE PARTICLES, OR EQUIVALENT.

- **Mythic weapons are unbreakable, cannot be dropped, enchanted, or moved into any other inventory. All are enchanted with curse of vanishing.**
- **Check the resource pack in run for the custom model strings**

1. Earth

Passive: Faster mining speed (haste 2 equivalent). anvils cost 80% less.

Utility: Supermine spell. Works with passive. Only one block counts towards durability breaking.

Combat: Magma bubble spell. Creates magma spikes in a 4x4 centered at the player, dealing 40% max hp. Must be activated within 1 block of solid ground, or in lava. Cooldown 45 seconds.

VFX: The spikes should be larger and denser than the demigod version.

Mythic Weapon: Colossus Hammer. Literally a retextured mace. Enchant with breach 2 and wind burst 1.

2. Sky

Passive: No fall damage. No dripstone damage. Double jump “spell” with an 8 second cooldown. Upon landing, entities within a 2 block radius take 10% max hp of damage.

VFX: On double jump, spawn a larger dash cone below the player than the demigod version. Upon landing, spawn the “mace smash” particles and play the sound effect.

Utility: Dash spell. Propels you 12 blocks in the direction you’re facing. Additionally dashing through an opponent does 20% max hp of damage.

VFX: Again, dash cone should be larger than for demigods.

Combat: Star strike spell. Summons a beam of light wherever you look to a maximum of 32 blocks, does 40% hp to anyone who touches it for the duration of the beam.

VFX: The glow of the god version should be black instead of white for the demigod version.

Mythic Weapon: Graviton Gauntlet. Shift + left click switches between pull + push mode. If there is a spell in the slot this weapon is in, unbind it and indicate to the player. Shift + right click activates the pull/push. Base item: Diamond Axe with sharpness 5 and efficiency 5.

VFX: Pull: Spawn blue particles in a sphere of radius 3 around the player that curve inwards towards the player. Push: Spawn red particles at the player and curve them outwards to the sphere of radius 3. The intention is to make it look like a spiral going in or out for each ability.

IMPL. SPECIFICS: When pulling, find the entities along the player's look vector within 10 blocks and launch them upwards + backwards towards the player. The closer they are to the 10 block threshold, the stronger they should be pulled. A similar logic for push, but in reverse. The closer the entity is to the player, the harder they should be pushed.

3. Ocean

Passive: Permanent conduit power instead of water breathing. Haste 2 mining speed in water. Dolphins Grace spell. Now allows you to switch between dolphins' grace 1, 2, and none.

IMPL. SPECIFICS: The player should receive haste 2 when actually submerged in water, not just "in water".

Utility: Molecular flux spell. Increase the time to 15 seconds and the maximum range to 40 blocks.

Combat: Drown spell. Increase the time to 10 seconds and the radius to 12 blocks. Also grants the god haste 1 for the duration of the spell.

Mythic Weapon: Tempest trident. Can be switched between riptide and loyalty by shift + left click. When thrown with loyalty, it strikes the target with lightning dealing 20% max hp every 3 hits, even outside of a thunderstorm. Same attack damage and speed as a sharpness 5 diamond sword. Base item: Trident.

VFX: When thrown, the tempest trident should have the same model as it does when in the player's hand, instead of a default trident. Spawn an item entity that is angled the same direction as the actual trident, and make the real trident entity invisible to achieve this effect. Play charging up sound effects to indicate how many hits left until the lightning strike.

IMPL. SPECIFICS: Disallow the trident to be picked up by anybody or anything other than the god that owns it. If anything happens such as throwing it into another dimension, into the void, the player leaves or is killed, remove the thrown entity and check if the player should receive a new copy of the item.

4. Magic

Passive: Permanent speed 2. Enchantments cost 90% less levels (level 30 enchantment will now only require 3). Illagers are passive.

Utility: All effects shorter than 10 minutes drank, from tipped arrows, or splashed onto you turn into 10 minute duration. Any and all other effect sources become 1 minute 30s. Excludes turtle master and negative effects.

VFX: Flame should be larger than for demigods.

Combat: Shapeshift spell. History is expanded to 8 transformations, and gods can transform into boss mobs and other players. Transformation duration is increased to a maximum of 45 seconds.

Mythic Weapon: Prism Wand. When fully charging the bow, arrows have aimbot. (similar artemis bow from hoplite). Copy enemy effects: When hitting a player with the wand as a melee weapon you copy their positive effects. Base item: Bow, enchant with power 5, flame.

VFX/IMPL. SPECIFICS: When fully charging the bow, trace a path from the player's look vector and identify the entity that is as close as possible to the path within a few degrees of error, it cannot be obstructed by solid blocks. If found, this is the target. Upon firing the arrow with a valid target, draw a pink terracotta block with glowing that spins along the straight line path to the target. Upon impact, deal 10% spell damage to the target. If there is no target, just fire a regular arrow.

5. Flora

Passive: Creakings are passive. Golden apples give an additional 2 hearts of absorption and 15 seconds of regeneration.

Utility: If the player has a plant block in their inventory: Mob aggro distance reduced by 90%. Creepers are passive.

Combat: Thorns spell. Thorns impale your opponents from the ground, freezing them for 4 seconds and giving them poison 1 for 10 seconds. This does 25% max hp. The pulling themselves out damage is increased to 15%.

Mythic Weapon: Vinewrath Axe. When you disable a shield using this weapon it disables for 10 seconds instead of 5 and freezes your opponent with vines for 3 seconds, like the thorns spell. Base item: Axe, enchant with sharpness 5 and efficiency 5.

6. Nether

Passive: Mobs in the nether are passive. Dolphins' grace 1 equivalent swimming speed in lava.

Utility: Ghast carry spell. Summons a double health happy ghast you can control and fly using. SPEED: 11.5 b/s.

Combat: Soul rage spell. For 30 seconds you deal more damage the lower you are, and take 1.2x damage.

Mythic Weapon: Hellfire Crossbow. Base item: crossbow, enchanted with quick charge 2, multishot, and piercing 4. If loaded with fireworks, every third firework launched is instead a beam of fire dealing 40% max hp to anything in its path.

VFX: Play charging sound effects to indicate how many firework launches until the beam of fire. Upon activation, the beam of fire should have a ½ block wide shroomlight laser core surrounded by an orange stained glass glow effect, similar to the star strike spell, except along the look vector and sideways. Around the orange stained glass, spawn spirals of flame particles that wrap around the main laser beam. Grow the beam upon initial firing, then shrink it and decrease the block opacity. Play a cool flame, respawn anchor, lightning, and totem sound effect to really give it impact. The intention is a terrifying beam that could end your life in an instant, going through anything and everything in its way like a wildfire.

IMPL. SPECIFICS: The farther away the entity is, the less damage it does up to a maximum of 60 blocks. Anything within 10 blocks receives 40% hp, and more than that scales based on the remaining distance.

7. End

Passive: End mobs are passive. ¼ pearl cooldown.

Utility: Teleport spell. Teleport 15 blocks in the direction you're facing. Goes through up to 4 blocks, and cannot spawn you in another block (suffocating). If there are no valid blocks the spell fails.

Combat: Desolation of time spell. All combat abilities are disabled for 10 seconds and weakness 1 applied within a 7 block radius for 15 seconds. Disables god weapon abilities.

Mythic Weapon: Ruinous Scythe. Getting a 4 hit combo deals 40% of the opponent's max health and deals between 15-20 additional durability damage to the target's armor combined. Base item: Sword, enchanted with sharpness 5, fire aspect 2, smite 5, bane of arthropods 5, sweeping edge 10.

VFX: Spawn an X of critical hit particles in front of the target player and play the wolf armor break sound effect and the "smashing break" sound effect.

IMPL. DETAILS: Keep track of a per-player combo counter. That is, suppose the god lands a 3 hit combo on player A, then player B hits the god. This does not reset the combo counter on player A because the counters are separate, so the next time the god hits player A the ability will still activate. Also, the combo counter does not go through shields. If a hit is blocked, the counter does not increment. If the god does not get a hit on the target for more than 3 seconds, the counter resets for that target.

Principles:

- If there is an existing feature in vanilla that does it, use the same logic instead of recreating it. Avoid completely remaking logic unless absolutely necessary for robustness.
- When referring to area, the order is X,Z,Y. So "4x4x2" means a square 4X, 4Z, and height 2. NOT X,Y,Z.
- Neutral mobs in minecraft are mobs that do not attack unless provoked (hit by the player). Passive mobs in minecraft are mobs that do not attack the player under any circumstances.

- Avoid sending the player chat messages as an indicator. Instead, use visual cues or the spell cooldown action bar manager to show what is being used.
- Spells should avoid negative effects on teammates, owned animals, and invulnerable entities. All other living entities are valid.
- Make sure to take into account how to clean up spell effects upon the caster leaving, going to another dimension, dying, or the server crashing. In general, things should be returned to the state before the effect occurred, so all block displays and particles are removed, any entities spawned are cleared, positive effects on the player are removed.
- Keep concrete numbers such as spell damage, cooldowns, durations, etc. in the config. Always check if there is an option in the config relevant to the current thing you're implementing.
- Absolutely EVERYTHING should be server side only. No registering new blocks/items, no client packets other than the vanilla ones. If in doubt, try to think of how the feature is implemented in bukkit/paper plugins.
- Do not assume that everything is exactly as written, the human writer may have forgotten certain crucial details. If in doubt, ask whenever there is confusion.
